HIGHLIGHTS

The preparation of CAS Center for Excellence in Life and Palaeoenvironment was finished

The preparation of CAS Center for Excellence in Life and Palaeoenvironment approved in September 2017 has just passed the assessment and evaluation by CAS in December 2020. It is based on both the Institute of Vertebrate Paleontology and Paleoanthropology, CAS (IVPP) and the NIGPAS.

With China's domestic unique geological and palaeontological resources, and various advanced technologies, the Center focuses on the interdisciplinary frontiers in palaeontology, stratigraphy and palaeoenvironment, striving for the understanding more deeply on the origin, radiation, extinction and recovery of the key taxa, groups and faunas/floras, on the basis of high-resolution stratigraphic subdivision and correlation, and on the mechanism of the co-evolution between life and environment.

A 520-million-year-old chimeric fossil uncovers the origin of arthropods

The discovery of a shrimp-like fossil with five eyes named *Kylinxia* from the Chengjiang fauna in Yunnan (southwest China) provides important insights into the early evolutionary history of arthropods. The study was conducted by scientists from Nanjing Institute of Geology and Palaeontology, Chinese Academy of Sciences (NIGPAS), and the results were published in *Nature* on November 4, 2020.

Kylinxia is a very rare chimeric species. It has a body showing distinctive features of true arthropods, such as a hardened cuticle, a segmented trunk and jointed legs. However, *Kylinxia* also integrates the morphological characters present in ancestral forms, which include the bizarre five eyes as in *Opabinia*, as well as the iconic raptorial appendages as in *Anomalocaris*.

Kylinxia represents a crucial transitional fossil predicted by Darwin's evolutionary theory. It bridges the evolutionary gap from *Anomalocaris* to true arthropods and forms a key 'missing link' in the origin of arthropods, contributing a strong fossil evidence for the evolutionary theory of life.

Scientists reveal the evolution of marine biodiversity in the Paleozoic era

The origin and evolution of life are the top ten scientific mysteries in the world and one of the 125 major scientific issues listed in the "Science" magazine. We have pressing, human-generated reasons to explore the influence of environmental change on biodiversity. Prior research resolutions are often too crude and imprecise to assess diversification rates or patterns associated with various global events (gradual, stepwise, or abrupt) and may mask multiple events as well as finer-scale fluctuations.

With the support of the Strategic Priority Research Programs (B) of the Chinese Academy of Sciences etc., the research results on the evolution of marine invertebrate biodiversity from the Cambrian to the early Triassic, which jointly completed by Nanjing University and NIGPAS et al., was published online in *Science* on January 17, 2020.

Here, the researchers combined with new Chinese data compilation, a new parallel computing implementation of CONOP.SAGA stratigraphic correlation algorithms, and the parallel processing power of the Tianhe II supercomputer have allowed the construction of a high-resolution composite species-diversity history with an average resolving power of 26.0 ± 14.9 kyr. Results indicate that the coarse and uneven temporal resolutions used by previous summaries artificially influenced paleobiodiversity estimations. This analysis confirms the existence of end-Ordovician and end-Permian mass extinctions, a long-term Middle to Late Devonian diversity decline, and a markedly subdued Frasnian–Famennian event.

Looking back can not only help us understand this relationship, but also help us understand current changes. This research is a breakthrough both earth science and data science. Under the framework of the DDE project, and based on global geological big data and efficient Tianhe II supercomputer methods, reconstruction of the complete life evolution history will be realized.

General trajectories of Paleozoic genus and species diversity and species diversity for 10 major fossil groups

Nanjing Museum of Palaeontology completed the exhibition reconfiguration and renovation

After 15 years of operation, Nanjing Museum of Palaeontology has successfully completed its exhibition reconfiguration and renovation in 2020, via the support from CAS, to show the public more fossil specimens and the latest palaeontological research progresses.

From December 26th to 27th, the "Ancient life Accompanies You and Me" large-scale theme science forum and the upgrading and reopening ceremony of the Nanjing Museum of Palaeontology, together with the 2020 Annual Meeting of the Science Popularization Network Committee of the Herbarium/Museum of the Chinese Academy of Sciences was held in Nanjing. At the opening ceremony of the conference, Academician ZHOU Zhonghe was invited to give a wonderful lecture titled "Secrets from Fossils-Talking about Paleontology". A series of popular science activities, including a forum for museum curators and school principals, etc. were held in the meantime. There were 15 experts from eight CAS institutes carried out science lectures to 15 primary or secondary schools in Nanjing, which attracted thousands of audiences.

INTERNATIONAL COLLABORATION

CAS-Durham webinar "Knowledge Across Borders"

On October 29, 2020, the Chinese Academy of Sciences and Durham University (UK) launched web lectures of "Knowledge Across Borders". The first issue was jointly conducted by Prof. David Harper from Durham University, and Prof. ZHAN Renbin from NIGPAS. The webinar was focused on a theme "The First Carnival of the Animals: Causes and Consequences of the Diversification of the Early Paleozoic Marine Life". More than 400 participants all over the world attended this webinar on line.

The poster is for a webinar titled "Knowledge Across Borders Webinar". It features two speakers: ZHAN Renbin, from the Nanjing Institute of Geology and Palaeontology, CAS, and David Harper, from Durham University. The event is scheduled for Thursday, October 29, 2020, at 16:00 (Beijing) / 08:00 (UK). The main topic is "THE FIRST CARNIVAL OF THE ANIMALS: Causes and Consequences of the Diversification of Early Palaeozoic Marine Life". The background of the poster shows a fossil of a trilobite on a dark, textured surface. Logos for the Chinese Academy of Sciences and Durham University are at the top.

Palaeozoic Marine Life*

Scientists from NIGPAS participated in international meeting

During September 7-10, 2020, the Project IGCP653 "The Initiation Process of Ordovician Biological Radiation Event" was hosted by the University of Copenhagen and held on the Zoom platform. This online conference included a 4-day academic report, attended by more than 200 experts and scholars from 28 countries. More than 10 participants including Prof. ZHANG Yuandong from NIGPAS registered and participated in the conference.

NEWS IN PICTURES

Perform the second comprehensive scientific investigation of the Qinghai-Xizang (Tibet) Plateau

From July to October, 2020, several research teams from NIGPAS together with scientists from Peking University, Nanjing University and some others went to the Qinghai-Xizang (Tibet) Plateau in batches to perform the second comprehensive scientific investigation.

This scientific expedition aims to systematically explore the strata in the Qinghai-Xizang Plateau, study the biodiversity, biological stratigraphy, chemical stratigraphy and chronostratigraphic framework of the Qinghai-Xizang Plateau, and reveal the inner relationship between paleontology, paleogeography and paleoenvironment of each block during the period.

The early life research team of NIGPAS went to the Qinghai-Xizang Plateau

The Cambrian Explosion research team of NIGPAS went to the Qinghai-Xizang Plateau

The Nanjing Stratigraphy and Palaeontology research team went to the Qinghai-Xizang Plateau

"The Qinghai-Xizang Plateau is a difficult-to-read book for stratigraphy and paleontology, and even for the entire earth sciences." Prof. ZHANG Yichun, leader of Nanjing Stratigraphy and Palaeontology research team, said frankly, "How did life and the environment evolve in the distant geological history? Maybe the answer would provide some clues for us to explore the relationship between living organisms and the environment."

Academic Activities with NIGPAS People

During November 6–10, 2020, the 19th Academic Annual Meeting of the Fossil Algae Professional Committee of the Palaeontological Society of China (PSC), with the 11th Member Representative Conference and the 18th Academic Annual Conference of the Micropaleontology Branch of PSC, as well as the 2020 Academic Annual Conference of the Jiangsu Paleontological Society, was successfully held in Chengjiang, Yunnan Province.

On October 20, the 5th National Geological and Palaeontological Science Popularization Symposium was held in the Inner Mongolia Natural Museum. More than 150 participants from over 60 units including scientific research institutes, universities, natural museums, popular science bases, national geological parks, key fossil producing areas, scientific and technological publishing organization and so on, attended this meeting.

Serve the National Economy

On July 3, 2020, NIGPAS and PetroChina Xinjiang Oilfield Company established a joint stratigraphic paleontology laboratory and held its first academic committee meeting.

On October 15, 2020, NIGPAS and Tianjin Branch of China National Offshore Oil Corporation (CNOOC Ltd) signed a strategic cooperation framework agreement.

Education

In September 2020, a welcome party was held for the institute new graduate students, 12 PhD and 15 MSc candidates in number. Now, the institute has 95 graduate students in total.

On June 13, 2020, the ceremony for the newly graduated MSc and PhD students from NIGPAS was held. This year, total of 20 graduate students including 6 PhD and 14 MSc candidates successfully graduated.

Science communication

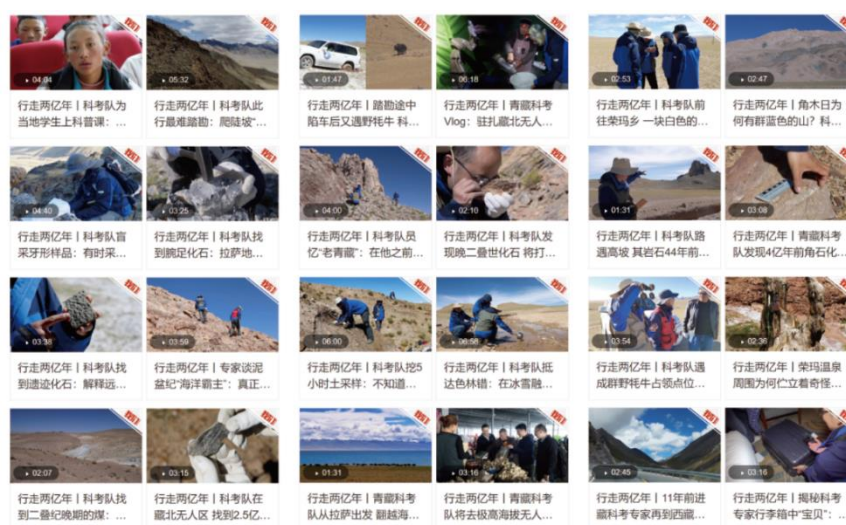

NIGPAS actively joint various social resources to promote the scientific communication toward high-quality and high-level. On July 15, 2020, Jiangsu Science and Technology Press, Phoenix Publishing & Media Group and NIGPAS jointly established the "Phoenix-NIGPAS Joint Science Communication Center", and launched the first cooperation about multimedia course.

For the development of the cultural and creative industries, on August 26, 2020, Vision Geology Space and NIGPAS jointly signed a strategic cooperation framework agreement to establish the "NIGPAS-VGS Joint Cultural and Creative Industry Development Center".

From September to October, 2020, *The Beijing News* "Through 200 Million Years" program recorded the Xizang scientific expedition of Nanjing Stratigraphy & Palaeontology research team from NIGPAS and Nanjing University, through 12 live broadcasts and 123 short videos. In the whole process, the video viewers reached 6.78 million, and the Weibo topic viewers were more than 30 million. Through these activities, the knowledge of stratigraphy & paleontology has been disseminated, and the science spirit of Qinghai-Xizang scientific research has also been demonstrated.

On September 25, 2020, the 2020 National Science Popularization Day in Jiangsu Province and the 13th Cross-Strait Science Popularization Forum were held in Nanjing. At the forum, Academician RONG Jiayu from NIGPAS gave a keynote speech entitled "Exploring the Mystery of Biological Evolution". He used wonderful fossil evidence to show the evolution process of life on Earth, to discuss the origin of life, the creation of life, and the great innovation, radiation and extinction of life, and to reveal the mystery of evolution.

New books

Ginkgo Plants systematically summarizes the research results of Chinese ginkgo plants over the past 100 years. As a comprehensive and systematic monograph on Chinese Ginkgo Plants, it is an important document for the Ginkgo study and will help to promote the development of paleobotany.

Book information:

ZHOU Zhiyan, YANG Xiaoju, WU Xiangwu, et al., 2020.

Ginkgo Plants. Science Press.

ISBN: 978-7-030-64221-9.

A special issue "Evolution of the Tibetan Neo-Tethys: Stratigraphy and Palaeogeography " was published in *Journal of Asian Earth Sciences* (Volume 204) on 28 July 2020. For decades, China has given sustained support to the geological study on the Qinghai-Xizang Plateau, a series of scientific research projects have been organized and conducted on the plateau and its adjacent areas. These projects promoted the research in many aspects including palaeontology. This special issue aims to exhibit and synthesize the new advances in biodiversity and ecosystems

of the Neo-Tethyan region in the Qinghai-Xizang Plateau as well as to explore the co-evolution of biotas and Neo-Tethys. Needless to say, other scientific issues in relation to the study of Neo-Tethys are also helpfully accommodated.

NIGPAS Equipments

NIGPAS has established an internationally advanced Experiment and Technology Center, to meet the research needs of palaeontology, stratigraphy and geological environment, which now has 39 sets of large-scale facilities and equipment, with a total asset value of up to 73.65 million Yuan (about 11.6 million USD).

XRF岩芯扫描仪
(Itrax)

高分辨率拉曼光谱仪
(Horiba HR Evolution)

X射线荧光光谱仪
(Horiba XRF XST-7200)

Since the establishment of the Experiment and Technology Center, in addition to providing high-quality services to all the institutes, it also has strongly supported for the large number of scientific research and innovation achievements over the years. Meanwhile, the Experiment and Technology Center has established the joint laboratory with other industrial companies, which has become an important technical support platform in the field of geology and palaeontology at home and abroad.

The institute is well-equipped with modern observational and analytical equipment and

facilities such as Micro-CT, field emission scanning electron microscope (Tescan MAIA3), confocal laser scanning microscope (LSM710), Horiba HR Evolution, Horiba XRF XGT-7200, Itrax Core Scanner XRF, isotope ratio mass spectrometers (MAT 253, DELTA V), ICP-OES, ICP-MS, MC-ICP-MS, TSQ Quantum GC, TIMS and peripherals in addition to fossil pretreatment laboratories.

无机碳氧稳定同位素质谱检测系统 (MAT 253)

电感耦合等离子体发射光谱仪 (ICP-OES)

电感耦合等离子体质谱仪 (ICP-MS)

多接收电感耦合等离子体质谱仪 (MC-ICP-MS)

热电质谱仪 (TIMS)

有机分子化石检测平台

硫同位素质谱检测系统 (Delta V Advantage)

WELCOME TO JOIN US

M.Sc., Ph.D., and Postdoctoral Programs

NIGPAS offers M.Sc. and Ph.D. degree-granting programs and a postdoctoral program in paleontology, stratigraphy, and geobiology. Undergraduate students or M.Sc. holders who are interested in applying for M.Sc. or Ph.D. programs are warmly welcome and are required to take the entrance examinations (two subjects respectively related to the particular specialities).

The postdoctoral program is open to young scientists worldwide who hold a Ph.D. degree and are under the age of 40. All Ph.D. holders of geology and related subjects who are interested in collaborating with staff members of NIGPAS are encouraged to contact us to start a new life at NIGPAS. The main research areas of our Institute include:

The Origin and Evolution of Early Life on Earth

Evolutionary Paleontology

Chronostratigraphy

Systematic Paleontology (of all invertebrate fossil groups and fossil plants)

Paleoecology, Paleogeography and Paleoclimatology

Molecular Paleobiology

Geobiology

Co-evolution of Life and Environment in deep time

Applied Paleontology and Stratigraphy

Interested applicants may contact relevant experts of our Institute or the particular office for foreign affairs of NIGPAS for more information (see contact information below).

Faculty Positions (3-5 yearly) Open: Applications invited

Recent Ph.D. holders and experienced scientists of various career levels, with research capabilities potentially enhancing or supplementing the current programs at NIGPAS (please refer to <http://english.nigpas.cas.cn/rh/rps/>), are invited to apply for our faculty positions. Interested persons are encouraged to send a letter of enquiry to the contact information below.

Recruitment for Senior Faculty Positions

As one of the academic leaders, successful applicant will be responsible to establish a research program in paleontology and related fields that will complement or enhance the institute current research programs. Interdisciplinary approaches are especially encouraged.

The applicant should have a demonstrable track record and abilities to develop an advanced research program in paleontology and related areas. A Ph.D. degree and former appointment at a senior level in universities or other academic institutions are required. A minimum of three years full time commitment is required for this position. For successful applicants, the institute will provide a start-up research grant (negotiable amount), necessary lab and office space, and supporting staff.

We also would appreciate your recommendation of any capable candidates. Please contact us.
